REVISED APPEAL BRIEF OF APPELLANTS UNDER 37 C.F.R. § 41.37

Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450

Sir:

Pursuant to the Notice of Non-Compliant Appeal Brief dated February 8, 2007, setting a

one-month period for response, up to and including March 8, 2007, Applicants' attorneys submit

this revised Appeal Brief, which is believed to address the Examiner's stated rationale for non-

compliance.

This is an Appeal from the Final Rejection by the Examiner dated April 7, 2006, which

issued in the above-identified application, finally rejecting claims 1, 9, 33, 41-48, 57, 65, 66 and

76; and from the Advisory Action dated July 14, 2006, confirming the rejection. A Notice of

Appeal was filed on August 14, 2006. This Brief is submitted in triplicate as required by 37

C.F.R. §1.192(a).

REAL PARTY IN INTEREST

The real party in interest is Sony Corporation, a Japanese corporation with offices at 7-35

Kitashinagawa 6-Chome, Shinagawa-Ku, Tokyo to which appellants have assigned all interest

in, to and under this application, by virtue of an assignment recorded on June 26, 2001 at reel

012056, frame 0052 of the assignment records of the Patent and Trademark Office.

RELATED APPEALS AND INTERFERENCES

Upon information and belief, the undersigned attorney does not believe that there is any

appeal or interference that will directly affect, be directly affected by or have a bearing on the

Board's decision in the pending appeal.

STATUS OF THE CLAIMS

The Application was filed with claims 1-64 on June 26, 2006, and assigned

Application Serial No. 09/869,254. The Application claims priority benefits based on PCT

Application PCT/JP99/07419, which was filed December 28, 1999, which in turn claims foreign

priority benefits under 35 U.S.C. §119 based on Japanese application 10-373855 (filed on

December 28, 1998).

A Preliminary Amendment was filed on June 26, 2001, amending claim 2.

In a first Office Action dated October 12, 2005, the Examiner rejected claims 3, 4,

11, 12, 19, 20, 27, 35, 36, 43, 51, 52 and 59 under 35 U.S.C. §112 and claims 1-64 were rejected

under 35 U.S.C. §102(e) as allegedly anticipated by U.S. Patent No. 5,917,990 to Zamara et al.

In response to this first Office Action, Appellants filed an Amendment on October

8, 2004 canceling claims 2-8, 10-32; amending claims 1, 9, 33, 35, 36, 41, 43, 44, 49, 51, 52, 57,

59 and 60; adding new claims 65-76 and arguing against the rejections.

The Examiner then issued a Final Office Action dated March 22, 2005, rejecting

claims 1, 9, 33, 41-48, 57, 65, 66 and 76. Claims 1, 9 and 33-64 were rejected under 35 U.S.C.

§102(e) as allegedly anticipated by U.S. Patent No. 5,917,990 to Zamara et al., claims 65-66, and

74-76 were rejected under 35 U.S.C. §102(e) as allegedly anticipated by U.S. Patent No.

6,738,100 to Hampapur, et al., claim 67 was rejected under 35 U.S.C. §103(a) as allegedly

unpatentable over U.S. Patent No. 6,452,875 to Lee et al., and claim 69-73 were rejected under

35 U.S.C. §103(a) as allegedly unpatentable over U.S. Patent No. 6,738,100 to Hampapur, et al.

in view of U.S. Patent No. 5,917,990 to Zamara et al.

In response to this Final Office Action, Appellants filed an Amendment under

Rule 116 on July 22, 2005 with Request for Continued Examination, canceling claims 34-40, 49-

56, 58-64, 67-75, amending claims 1, 9, 33, 41, 57, 65, 66 and 76 and arguing against the

rejections.

In an Office Action dated October 12, 2005, the Examiner objected to claim 64

and claims 1 and 33 were rejected under 35 U.S.C. §102(e) as allegedly anticipated by U.S.

Patent No. 5,917,990 to Zamara et al. Claims 9, 41-48, and 57 were rejected under 35 U.S.C.

§103(a) as allegedly unpatentable over U.S. Patent No. 5,917,990 to Zamara, et al. in view of

U.S. Patent No. 5,995,095 to Ratakonda and claims 65, 66, and 76 were rejected under 35 U.S.C.

§103(a) as allegedly upatentable over U.S. Patent No. 6,738,100 to Hampapur, et al. in view of

U.S. Patent No. 5,995,095 to Ratakonda.

In response to this Office Action, Appellants filed an Amendment on January 11,

2006 amending claims 1 and 33 and arguing against the rejections.

The Examiner then issued a Final Office Action dated April 7, 2006, rejecting

claims 1, 9, 33, 41-48, 57, 65, 66 and 76. In that, claims 1 and 33 were rejected under 35 U.S.C.

§102(e) as allegedly anticipated by U.S. Patent No. 5,917,990 to Zamara et al., claims 9, 41-48,

and 57 were rejected under 35 U.S.C. §103(a) as allegedly unpatentable over U.S. Patent No.

5,917,990 to Zamara, et al. in view of U.S. Patent No. 5,995,095 to Ratakonda and claims 65, 66,

and 76 were rejected under 35 U.S.C. §103(a) as allegedly upatentable over U.S. Patent No.

6,738,100 to Hampapur, et al. in view of U.S. Patent No. 5,995,095 to Ratakonda.

In response to this Final Office Action, Appellants filed an Amendment under

Rule 116 on June 7, 2006, simply arguing against the rejections.

The Examiner issued an Advisory Action dated July 14, 2006, indicating the

arguments were considered but did not overcome the rejection. The Examiner maintained the

rejection of claims 1, 9, 33, 41-48, 57, 65, 66 and 76.

A Notice of Appeal was filed by Appellants on August 14, 2006 appealing the final rejection of these claims. This Appeal Brief is being filed pursuant to this Notice of Appeal. Accordingly, the status of the claims may be summarized as follows:

Claims allowed: none

Claims objected to: none

Claims rejected: 1, 9, 33, 41-48, 57, 65, 66 and 76

The rejected claims 1, 9, 33, 41-48, 57, 65, 66 and 76 are set forth in the Appendix attached hereto. Appellants are appealing the Final Rejection of claims 1, 9, 33, 41-48, 57, 65, 66 and 76, which constitute all of the currently pending claims in this application.

STATUS OF THE AMENDMENTS

Appellant believes that all the submitted Amendments have been entered.

SUMMARY OF THE CLAIMED SUBJECT MATTER

The citations to Figures and/or Specification locations are provided immediately following the elements of the independent claims, which are summarized below. Such citations, however, are provided merely as examples and are not intended to limit the interpretation of the claims or to evidence or create any estoppel. Support for each of these claims can be found throughout the specification as originally filed.

Claim 1, is directed to a video information editing method (Page 40, line 9-page 49, line 2) comprising the steps of delimiting at timing of a delimiting instruction a regular edition video (Page 45, line 13-page 47, line 19, Figs. 3-6), constituted by continuous dynamic images recorded along with recording position information or time lapse information (Figs. 3-6), into

00415800

shots as units of dynamic images or into scenes each containing at least one shot with the recording position information or the time lapse information associated with the shots or scenes (Figs. 3-6). An evaluation value is prepared of each of the shots or each of the scenes on the basis of the information provided corresponding to each of the shots or each of the scenes (Page 41, line 17-page 44, line 11, Figs. 3-6, 12), wherein the information provided includes semantic evaluation information (Figs. 7-8), and wherein the information provided includes information relating to a presence/absence of a single or a plurality of video characteristic items (Page 45, lines 7-12, Figs. 3-6); and selecting from the regular edition video the shots or the scenes such that each of the evaluation values of the shots or the scenes satisfies a predetermined condition (Page 40, line 9-page 49, line 2).

Claim 9 is directed to a video information editing method (Page 40, line 9-page 71, line 1) comprising the steps of delimiting at timing of a delimiting instruction a regular edition video (Page 45, line 13-page 47, line 19; Figs. 3-6), constituted by continuous dynamic images recorded along with recording position information or time lapse information (Figs. 3-6), into shots as units of dynamic images and into scenes each containing at least one shot with the recording position information or the time lapse information associated with the shots or scenes (Figs. 3-6). A semantic evaluation value is prepared of each of the scenes on the basis of the information provided corresponding to each of the scenes (Page 41, line 17-page 44, line 11; Figs. 7-8); selecting from the regular edition video the scenes such that each of the semantic evaluation values of the scenes satisfies a predetermined first condition (Page 69, line 15-page 71, line 1; Figs. 7-8). An evaluation value is prepared of at least one of the shots included in each of the selected scenes on the basis of the information provided corresponding to a single or a plurality of video characteristic items of the shots (Figs. 3-6, 12). The shots are selected such

that each of the evaluation values of the shots satisfies a predetermined second condition (Page 69, line 15-page 71, line 1), wherein the first and second condition are set in accordance with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different purposes (Page 40, line 9-page 71, line 1).

Claim 33 is directed to a video information editing device (Page 54, line 21-page 63, line 15; Figs. 11, 22 and 24) comprising means for delimiting at timing of a delimiting instruction a regular edition video (Sg; Fig. 11), constituted by continuous dynamic images recorded along with recording position information or time lapse information (Ip1, Prg11, Fig. 11), into shots as units of dynamic images or into scenes each containing at least one shot with the recording position information or the time lapse information associated with the shots or scenes (Fig. 3-6). Also included are means for preparing an evaluation value of each of the shots or each of the scenes on the basis of the information provided corresponding to each of the shots or each of the scenes (Ip2, Fig. 11; Ip6, Fig. 24), wherein the information provided includes semantic evaluation information (Figs. 7-8), and wherein the information provided includes information relating to a presence/absence of a single or a plurality of video characteristic items; and means for selecting from the regular edition video the shots or the scenes such that each of the evaluation values of the shots or the scenes satisfies a predetermined condition (Tab 5, Fig. 24).

Claim 41 is directed to a video information editing device (Page 54, line 21-page 63, line 15; Figs. 11, 22 and 24) comprising means for delimiting at timing of a delimiting instruction a regular edition video (Sg; Fig. 11), constituted by continuous dynamic images recorded along with recording position information or time lapse information (Ip1, Prg11, Fig. 11), into shots as units of dynamic images and into scenes each containing at least one shot with the recording position information or the time lapse information associated with the shots or scenes (Figs. 3-6).

Also included are means for preparing a semantic evaluation value of each of the scenes on the

basis of the information provided corresponding to each of the scenes (Ip2, Fig. 11; Ip6, Fig. 24);

means for selecting from the regular edition video (Sg, Fig. 11) the scenes such that each of the

semantic evaluation values of the scenes satisfies a predetermined first condition (Page 69, line

15-page 71, line 1; Figs. 7-8); means for preparing an evaluation value of at least one of the shots

included in each of the selected scenes on the basis of the information provided corresponding to

a single or a plurality of video characteristic items of the shots (Figs. 3-6, 12); and means for

selecting the shots such that each of the evaluation values of the shots satisfies a predetermined

second condition (Page 69, line 15-page 71, line 1), wherein the first and second conditions are

set in accordance with a type of preview, the type of preview being selected from a plurality of

types of previews, which are set for different purposes (Tab 5, Fig. 24).

Claim 57 is directed to a video information editing device (Figs. 11, 22 and 24)

comprising means for delimiting at timing of a delimiting instruction a regular edition video (Ip

1, Prg11, Fig. 11), constituted by continuous dynamic images recorded along with recording

position information or time lapse information (Figs. 3-6), into shots as units of dynamic images

and into scenes each containing at least one shot with the recording position information or the

time lapse information associated with the shots or scenes (Figs. 3-6); means for preparing a

semantic evaluation value of each of the scenes on the basis of the information provided

corresponding to each of the scenes (Ip2, Fig. 11; Ip6, Fig. 24); means for selecting from the

regular edition video the scenes such that each of the semantic evaluation values of the scenes

satisfies a predetermined first condition (Page 69, line 15-page 71, line 1; Figs. 7-8); means for

preparing an evaluation value of at least one of the shots included in each of the selected scenes

on the basis of the information provided corresponding to a single or a plurality of video

00415800

characteristic items of the shots, wherein the information provided corresponding to each of the shots includes semantic evaluation information and video characteristic items (Page 69, line 15-page 71, line 1; Figs. 11, 22 and 24); means for selecting the shots such that each of the evaluation values of the shots satisfies a predetermined second condition (Page 69, line 15-page 71, line 1; Figs. 11, 22 and 24); and means for coding the information of the recording position information or the time lapse information corresponding to each of the selected shots and data including at least the shot evaluation value, wherein the first and second conditions are set in accordance with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different purposes (Tab 5, Fig. 24).

Claim 65 is directed to a method for generating a preview from a video (Page 41, line 6-page 42, line 6; Figs. 1-10, 13-21, 23 and 25) comprising the steps of accessing a segment of the video (Figs. 3-6); establishing a plurality of shots from the segment of the video; providing semantic evaluation information related to content of one or more of the plurality of shots (Page 41, line 6-page 42, line 6; Figs. 7-8); evaluating a single or a plurality of video characteristics of one or more of the plurality of shots; selecting particular shots as a function of the semantic evaluation information and the single or plurality of video characteristics (Figs. 3-8, 12); and generating the video by concatenating the selected particular shots such that the video has a predetermined time duration, wherein the selecting particular shots is performed using predetermined conditions associated with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different preview purposes (Page 41, line 6-page 42, line 6).

Claim 66 is directed to an apparatus (Page 63, line 16 - page 72, line 16; Figs. 11, 22 and 24) for generating a preview from a video comprising means for accessing a segment of the

00415800

video (Figs. 3-6); means for establishing a plurality of shots from the segment of the video (Figs. 3-6); means for providing semantic evaluation information related to content of one or more of the plurality of shots (Figs. 7-8); means for evaluating a single or a plurality of video characteristics of one or more of the plurality of shots; means for selecting particular shots as a function of the semantic evaluation information and the single or a plurality of video characteristics (Page 63, line 16 - page 72; Figs. 7-8); and means for generating the video by concatenating the selected particular shots such that the video has a predetermined time duration (Page 63, line 16 - page 72; Figs. 3-8, 12), wherein the selecting particular shots is performed using predetermined conditions associated with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different preview purposes (Tab 5, Fig. 24).

Claim 76 is directed to a computer-readable medium (Page 42, line 7-page 44, line 3) adapted to store a computer program for generating a preview from a video, comprising program code for accessing a segment of the video; program code for establishing a plurality of shots from the segment of the video (Figs. 1-10); program code for providing semantic evaluation information related to content of one or more of the plurality of shots (Figs. 1-10); program code for evaluating a single or a plurality of video characteristics of one or more of the plurality of shots (Figs. 12-21); program code for selecting particular shots as a function of the semantic evaluation information and a single or a plurality of video characteristics (Figs. 1-10); and program code for generating video by concatenating the selected particular shots such that the video has a predetermined time duration (Figs. 12-21), wherein the selecting particular shots is performed using predetermined conditions associated with a type of preview, the type being

00415800

selected from a plurality of types of previews, which are set for different preview purposes (Figs.

13-21, 23 and 25).

GROUNDS FOR REJECTION TO BE REVIEWED ON APPEAL

Claims 1 and 33 are rejected under 35 U.S.C. §102(e) as allegedly anticipated by U.S. Patent No. 5,917,990 to Zamara et al. Claims 9, 41-48, and 57 are rejected under 35 U.S.C. §103(a) as allegedly unpatentable over U.S. Patent No. 5,917,990 to Zamara, et al. in view of U.S. Patent No. 5,995,095 to Ratakonda. Claims 65, 66, and 76 are rejected under 35 U.S.C. §103(a) as allegedly upatentable over U.S. Patent No. 6,738,100 to Hampapur, et al. in view of U.S. Patent No. 5,995,095 to Ratakonda.

ARGUMENTS

Claims 1 and 33 were rejected under 35 U.S.C. §102(e) as allegedly anticipated

by U.S. Patent No. 5,917,990 to Zamara et al.

Claim 1 recites, *inter alia*:

"...preparing an evaluation value of each of the shots or each of
the scenes on the basis of the information provided corresponding
to each of the shots or each of the scenes,

wherein the information provided includes semantic evaluation
information,
wherein the information provided includes information relating to
a presence/absence of a single or a plurality of video characteristic
items...

...selecting from the regular edition video the shots or the scenes
such that each of the evaluation values of the shots or the scenes
satisfies a predetermined condition." (emphasis added)

As understood by Applicants, U.S. Patent No. 5,917,990 to Zamara et al.

(hereinafter, merely "Zamara") relates to a process that allows precise control of the tape

position in consumer videotape devices for the purpose of video editing. The process utilized

software to locate a specific video frame within the digitized video. The process involves storing

an initial set of calculated scene data, which include luminance and change in luminance values

for each video frame. A second set of scene detection data is taken a reference point near the

desired frame. The two values are compared and the videotape position is adjusted accordingly.

Applicants respectfully submit that nothing has been found in Zamara that would

teach or suggest the above-identified feature of claim 1. Specifically, Applicants submit that

Zamara fails to teach or suggest preparing an evaluation value of each of the shots or each of the

scenes on the basis of the information provided corresponding to each of the shots or each of the

scenes, wherein the information provided includes semantic evaluation information and wherein

the information provided includes information relating to a presence/absence of a single or a

plurality of video characteristic items, and selecting from the regular edition video the shots or

the scenes such that each of the evaluation values of the shots or the scenes satisfies a

predetermined condition, as recited in claim 1.

Applicants submit that the cited portions of Zamara, specifically col 3, lines 25-34

and lines 39-47, disclose the calculation of scene detect data from a single frame of video using

an average frame luminance value.

Applicants submit that such disclosure <u>does not</u> disclose "the information

provided includes semantic evaluation information" and that "the information provided includes

information relating to a presence/absence of a single or a plurality of video characteristic

items", as stated in the Office Action and therefore, <u>does not</u> render claim 1 unpatentable.

Therefore, claim 1 is patentable.

For reasons similar to those described above, independent claim 33 is also

believed to be patentable.

<u>Claims 9, 41-48, and 57 were rejected under 35 U.S.C. §103(a) as allegedly</u>

<u>unpatentable over U.S. Patent No. 5,917,990 to Zamara, et al. in view of U.S. Patent No.</u>

<u>5,995,095 to Ratakonda.</u>

Claim 9 recites, *inter alia*:

"...<u>wherein the first and second condition are set in accordance</u>
<u>with a type of preview</u>, the type of preview being selected from a
plurality of types of previews, which are set for different
purposes." (emphasis added)

As understood by Applicants, U.S. Patent No. 5,995,095 to Ratakonda (hereinafter merely "Ratakonda") relates to hierarchical digital video summarization and browsing that includes inputting a digital video signal for a digital video sequence and then generating a hierarchical summary based on keyframes of the video sequence.

Applicants respectfully submit that nothing has been found in Zamara or Ratakonda, taken alone or in combination, that would teach or suggest the above-identified features of claim 9. Applicants submit that the cited portions of Ratakonda, col. 3 lines 40-52 and col. 5, lines 48-55, relate to hierarchical multilevel summary of single frames. The cited portions of Ratakonda do not teach or suggest anything about conditions being set.

Applicants submit that such disclosure does not disclose "the first and second condition are set in accordance with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different purposes" and therefore, does not render claim 9 unpatentable.

Specifically, Applicants submit that Zamara and Ratakonda fail to teach or suggest that the first and second condition are set in accordance with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different purposes.

Therefore, claim 9 is patentable.

For reasons similar to those described above, independent claims 41 and 57 are also believed to be patentable.

<u>Claims 65, 66, and 76 were rejected under 35 U.S.C. §103(a) as allegedly</u>

<u>upatentable over U.S. Patent No. 6,738,100 to Hampapur, et al. in view of U.S. Patent No.</u>

<u>5,995,095 to Ratakonda.</u>

Claim 65 recites, *inter alia*:

"...wherein the selecting particular shots is performed using
predetermined conditions associated with a type of preview, the
type of preview being selected from a plurality of types of
previews, which are set for different preview purposes."

As understood by Applicants, U.S. Patent No. 6,738,100 to Hampapur, et al.

(hereinafter, merely "Hampapur") relates to processing video to extract a key-frame based

adequate visual representation. A chromatic difference metric is extracted from a pair of video

frames. An initial set of frames is chosen based the chromatic metric and a first threshold. A

structural difference measurement is then extracted. A second threshold is used to select key

frames from the initial set of frames. The output of this process is the visual representation.

Applicants respectfully submit that nothing has been found in Hampapur or

Ratakonda, taken alone or in combination, that would teach or suggest the above-identified

feature of claim 65.

Applicants submit that the cited portions of Ratakonda, col. 3 lines 40-52 and col.

5, lines 48-55, relate to hierarchical multilevel summary of single frames.

The cited portions of Ratakonda do not teach or suggest anything about using

predetermined conditions associated with a type of preview to select particular shots and

therefore, such disclosure does not render claim 65 unpatentable.

Specifically, Applicants submit that Hampapur and Ratakonda fail to teach or

suggest that the selecting particular shots is performed using predetermined conditions associated

00415800

with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different preview purposes. Therefore, claim 65 is patentable.

For reasons similar to those described above, independent claims 66 and 76 are also believed to be patentable.

The other claims in this application are each dependent from one of the independent claims discussed above and are therefore believed patentable for at least the same reasons. Since each dependent claim is also deemed to define an additional aspect of the invention, however, the individual reconsideration of the patentability of each on its own merits is respectfully requested.
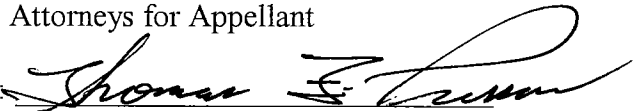

CONCLUSION

For the reasons discussed above, claims 1, 9, 33, 41-48, 57, 65, 66 and 76 are patentable.

It is, therefore, respectfully submitted that the Examiner erred in rejecting claims 1, 9, 33, 41-48,

57, 65, 66 and 76, and Appellant requests a reversal of these rejections by this Honorable Board.

As a result, the allowance of this application should be mandated.

The Commissioner is hereby authorized to charge any additionally required fee, or to

credit any overpayment in such fees, to Deposit Account No. 50-0320.

Respectfully submitted,

APPENDIX I

CLAIMS ON APPEAL

1.   (Previously Presented) A video information editing method comprising the steps of:

delimiting at timing of a delimiting instruction a regular edition video, constituted by continuous dynamic images recorded along with recording position information or time lapse information, into shots as units of dynamic images or into scenes each containing at least one shot with the recording position information or the time lapse information associated with the shots or scenes;

preparing an evaluation value of each of the shots or each of the scenes on the basis of the information provided corresponding to each of the shots or each of the scenes,

wherein the information provided includes semantic evaluation information, and

wherein the information provided includes information relating to a presence/absence of a single or a plurality of video characteristic items; and

selecting from the regular edition video the shots or the scenes such that each of the evaluation values of the shots or the scenes satisfies a predetermined condition.

2-8.   (Canceled)

9.   (Previously Presented) A video information editing method comprising the steps of:

delimiting at timing of a delimiting instruction a regular edition video, constituted by continuous dynamic images recorded along with recording position information or time lapse

information, into shots as units of dynamic images and into scenes each containing at least one

shot with the recording position information or the time lapse information associated with the

shots or scenes;

preparing a semantic evaluation value of each of the scenes on the basis of the

information provided corresponding to each of the scenes;

selecting from the regular edition video the scenes such that each of the semantic

evaluation values of the scenes satisfies a predetermined first condition;

preparing an evaluation value of at least one of the shots included in each of the

selected scenes on the basis of the information provided corresponding to a single or a plurality

of video characteristic items of the shots; and

selecting the shots such that each of the evaluation values of the shots satisfies a

predetermined second condition,

wherein the first and second condition are set in accordance with a type of

preview, the type of preview being selected from a plurality of types of previews, which are set

for different purposes.

10-32. (Canceled)

33.   (Previously Presented) A video information editing device comprising:

means for delimiting at timing of a delimiting instruction a regular edition video,

constituted by continuous dynamic images recorded along with recording position information or

time lapse information, into shots as units of dynamic images or into scenes each containing at

00415800

least one shot with the recording position information or the time lapse information associated with the shots or scenes;

means for preparing an evaluation value of each of the shots or each of the scenes on the basis of the information provided corresponding to each of the shots or each of the scenes,

wherein the information provided includes semantic evaluation information, and

wherein the information provided includes information relating to a presence/absence of a single or a plurality of video characteristic items; and

means for selecting from the regular edition video the shots or the scenes such that each of the evaluation values of the shots or the scenes satisfies a predetermined condition.

34-40. (Canceled)

41. (Previously Presented) A video information editing device comprising:

means for delimiting at timing of a delimiting instruction a regular edition video, constituted by continuous dynamic images recorded along with recording position information or time lapse information, into shots as units of dynamic images and into scenes each containing at least one shot with the recording position information or the time lapse information associated with the shots or scenes;

means for preparing a semantic evaluation value of each of the scenes on the basis of the information provided corresponding to each of the scenes;

means for selecting from the regular edition video the scenes such that each of the semantic evaluation values of the scenes satisfies a predetermined first condition;

means for preparing an evaluation value of at least one of the shots included in each of the selected scenes on the basis of the information provided corresponding to a single or a plurality of video characteristic items of the shots; and

means for selecting the shots such that each of the evaluation values of the shots satisfies a predetermined second condition,

wherein the first and second conditions are set in accordance with a type of preview, the type of preview being selected from a plurality of types of previews, which are set for different purposes.

42.   (Original) The video information editing device as claimed in claim 41, further comprising means for, if the length of a video produced by connecting selected shots exceeds a predetermined video time, modifying at least one of the predetermined first condition and second condition and repeating the processing until the length of the video becomes equal to the predetermined video time.

43.   (Previously Presented) The video information editing device as claimed in claim 41, wherein the predetermined first condition is that an absolute value of the scene evaluation value related to the scene reaches a predetermined threshold value, and

wherein with respect to an integration value of the evaluation value related to each of the scenes along the scene transition, the scene is a peak scene when the continuous increase of the integration value up to a scene exceeds a predetermined first gap value and the absolute value of the continuous decrease of the integration value after that scene exceeds a predetermined second gap value,

while the scene is a valley scene when the absolute value of the continuous decrease of the integration value up to a scene exceeds a predetermined third gap value and the continuous increase of the integration value after that scene exceeds a predetermined fourth gap value, and

the threshold value is determined for each area between the peak or valley scene and the adjacent valley or peak scene.

44.   (Previously Presented) The video information editing device as claimed in claim 41, wherein with respect to an integration value of the evaluation value related to each of the scenes along the scene transition, the scene is a peak scene when the continuous increase of the integration value up to a scene exceeds a predetermined first gap value and an absolute value of the continuous decrease of the integration value after that scene exceeds a predetermined second gap value,

while the scene is a valley scene when the absolute value of the continuous decrease of the integration value up to a scene exceeds a predetermined third gap value and the continuous increase of the integration value after that scene exceeds a predetermined fourth gap value, and

the predetermined first condition is applied to the scenes on the upward slope to the peak from the adjacent valley before the peak and the scenes on the downward slope immediately after the peak, on the basis of the magnitude of the increase of the integration value of the valley scene and the adjacent peak scene after the valley, or on the basis of the ranking of the magnitude of the increase of the integration value.

45. (Original) The video information editing device as claimed in claim 43, wherein the predetermined first condition is that the absolute value of the scene evaluation value related to the scenes reaches a predetermined threshold value, and the threshold value is set in accordance with the upward slope from the valley to the adjacent peak or the downward slope from the peak to the adjacent valley.

46. (Original) The video information editing device as claimed in claim 43, wherein the predetermined first condition is that the absolute value of the scene evaluation value related to the scenes reaches a predetermined threshold value, and when each of the evaluation values is formed by a positive or negative value, the absolute value of the threshold value applied to the positive evaluation value is made equal to or smaller than the absolute value of the threshold value applied to the negative evaluation value.

47. (Original) The video information editing device as claimed in claim 41, wherein the shot evaluation value is a value obtained by adding a value obtained by carrying out predetermined weighting on each of the video characteristic items including at least the presence of a speech, the volume of a predetermined level or higher, the appearance of a specified actor/actress, or the special picture effect in the corresponding part of the regular edition video, with respect to each of the items.

48. (Original) The video information editing device as claimed in claim 47, wherein with respect to the shot evaluation value, the weighting value on the item related to the

appearance of a specified actor/actress is made greater than the weighting values on the other

items.

        49-56. (Canceled)

        57.   (Previously Presented) A video information editing device comprising:

        means for delimiting at timing of a delimiting instruction a regular edition video,

constituted by continuous dynamic images recorded along with recording position information or

time lapse information, into shots as units of dynamic images and into scenes each containing at

least one shot with the recording position information or the time lapse information associated

with the shots or scenes;

        means for preparing a semantic evaluation value of each of the scenes on the

basis of the information provided corresponding to each of the scenes;

        means for selecting from the regular edition video the scenes such that each of the

semantic evaluation values of the scenes satisfies a predetermined first condition;

        means for preparing an evaluation value of at least one of the shots included in

each of the selected scenes on the basis of the information provided corresponding to a single or

a plurality of video characteristic items of the shots,

        wherein the information provided corresponding to each of the shots includes

semantic evaluation information and video characteristic items;

        means for selecting the shots such that each of the evaluation values of the shots

satisfies a predetermined second condition; and

means for coding the information of the recording position information or the

time lapse information corresponding to each of the selected shots and data including at least the

shot evaluation value,

wherein the first and second conditions are set in accordance with a type of

preview, the type of preview being selected from a plurality of types of previews, which are set

for different purposes.

58-64. (Canceled)

65.   (Previously Presented) A method for generating a preview from a video

comprising the steps of:

accessing a segment of the video;

establishing a plurality of shots from the segment of the video;

providing semantic evaluation information related to content of one or more of the

plurality of shots;

evaluating a single or a plurality of video characteristics of one or more of the

plurality of shots;

selecting particular shots as a function of the semantic evaluation information and

the single or plurality of video characteristics; and

generating the video by concatenating the selected particular shots such that the

video has a predetermined time duration,

wherein the selecting particular shots is performed using predetermined

conditions associated with a type of preview, the type of preview being selected from a plurality

of types of previews, which are set for different preview purposes.

66.   (Previously Presented) An apparatus for generating a preview from a

video comprising:

   means for accessing a segment of the video;

   means for establishing a plurality of shots from the segment of the video;

   means for providing semantic evaluation information related to content of one or

more of the plurality of shots;

   means for evaluating a single or a plurality of video characteristics of one or more

of the plurality of shots;

   means for selecting particular shots as a function of the semantic evaluation

information and the single or a plurality of video characteristics; and

   means for generating the video by concatenating the selected particular shots such

that the video has a predetermined time duration,

   wherein the selecting particular shots is performed using predetermined

conditions associated with a type of preview, the type of preview being selected from a plurality

of types of previews, which are set for different preview purposes.

   67-75. (Canceled)

76.   (Previously Presented) A computer-readable medium adapted to store a
computer program for generating a preview from a video, comprising:

program code for accessing a segment of the video;

program code for establishing a plurality of shots from the segment of the video;

program code for providing semantic evaluation information related to content of
one or more of the plurality of shots;

program code for evaluating a single or a plurality of video characteristics of one
or more of the plurality of shots;

program code for selecting particular shots as a function of the semantic
evaluation information and the a single or a plurality of video characteristics; and

program code for generating video by concatenating the selected particular shots
such that the video has a predetermined time duration,

wherein the selecting particular shots is performed using predetermined
conditions associated with a type of preview, the type being selected from a plurality of types of
previews, which are set for different preview purposes.
